

Task 1: Problem Statement & Objective Definition

Spam Mail Detection System

Step 1: Problem Statement

Email users receive many unwanted spam emails such as advertisements, phishing links, and scams. These spam emails create security risks and waste users' time.

Step 2: Goal / Objective

To build a Machine Learning model that automatically detects whether an email is spam or not spam using text analysis.

Step 3: ML Type

Binary Classification

Step 4: Tools Used

- Python
- Jupyter Notebook
- Google Docs
- Jira
- Miro

Step 5: Expected Outcome

The system should automatically classify spam and non-spam emails accurately and help users filter unwanted emails.
